

Types Of Functions

6 Ways

A yellow square containing the letters 'JS' in a bold, black, sans-serif font, representing JavaScript.

Mallikarjun | @CodeBustler

JS **Functions** | 6 Ways

- **Named Functions**
- **Anonymous Functions**
- **Arrow Functions**
- **Immediately Invoked Function**

Expressions (IIFE)

- **Higher Order Functions**
- **Constructor Functions**

1. Named Functions

Lazacy / Traditional way

JS

function.js

```
function myFunction() {  
  console.log("CodeBustler");  
}  
  
myFunction();
```

@CodeBustler

2. Anonymous Functions

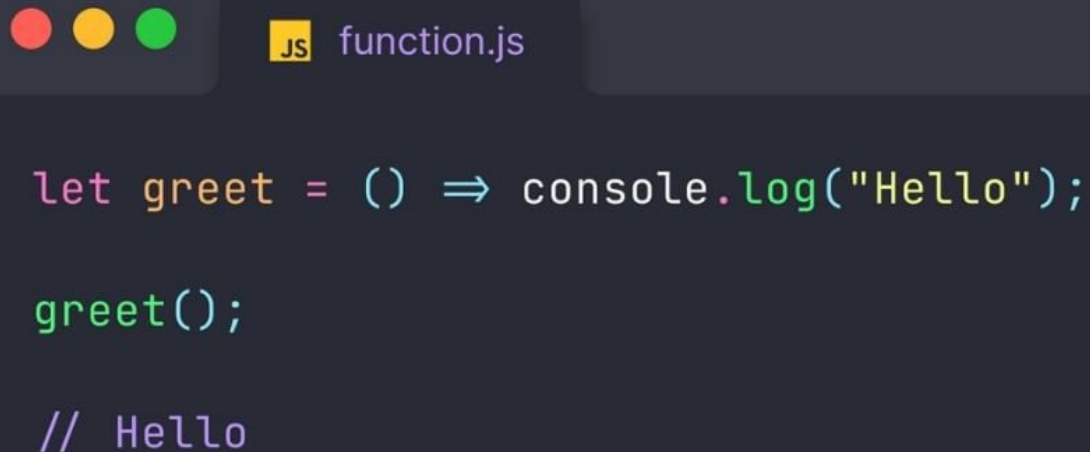

Anonymous Functions | without name, used as function expression or arguments

```
let greet = function (name) {  
  console.log(`Hello ${name}`);  
};  
  
greet("Sai");  
  
// Hello Sai
```

3. Arrow Functions

Arrow Functions Introduced in **ES6**,
Shorter Syntax & one-lined functions

```
let greet = () => console.log("Hello");  
  
greet();  
  
// Hello
```

The image shows a code editor window with a title bar containing three colored circles (red, yellow, green) and a tab labeled 'JS function.js'. The code inside the editor is as follows:

4. IIFE Functions

Immediately Invoked Function Expressions (IIFE) Executed immediately after their creation. Used to create private scopes and avoid polluting the global namespace.

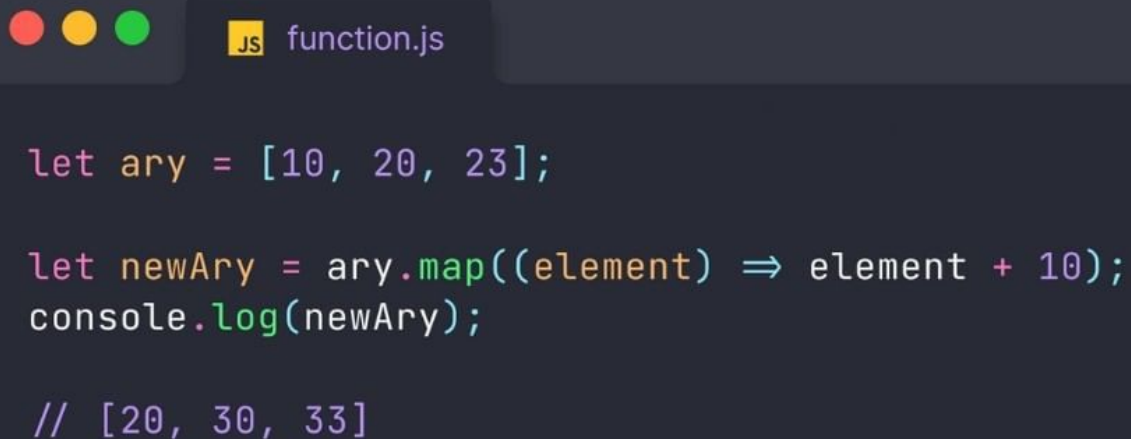

A code editor window with a dark theme. The title bar shows three colored circles (red, yellow, green) and a tab labeled 'JS function.js'. The code is as follows:

```
(function () {  
    let str = "Good Evening";  
    console.log(str);  
})();  
  
// Good Morning (Immediate Invoked)
```

5. Higher Order Func

Functions that take one or more **functions as arguments** or return a function.

eg: `map()`, `filter()`, `reduce()`

A code editor window with a dark theme. The title bar shows three colored circles (red, yellow, green) and a tab labeled 'JS function.js'. The code inside the editor is as follows:

```
let ary = [10, 20, 23];

let newArray = ary.map((element) => element + 10);
console.log(newArray);

// [20, 30, 33]
```

6. Constructor Function

Used as blueprints for **creating objects with similar properties** and methods. They are invoked using the **new** keyword to create instances of objects.

```
function Person(name, place) {  
  this.name = name;  
  this.place = place;  
}  
  
let user1 = new Person("CodeBustler", "India");  
  
console.log(`Hello everyone this is ${user1.name},  
            and i am from ${user1.place}`);  
  
// Hello everyone this is CodeBustler, and i am from India
```
